Notes:

- When measuring cross regulation, the load on one output is varied from 25% to 100% while the other output is held at 100%.
- When measuring output ripple, it is recommended that an external 1.0 μ F ceramic capacitor be placed from the +Vout pin to the -Vout pin for single output units and from each output to common for dual output units. For noise sensitive applications, the use of 3.3 μ F capacitors will reduce the output ripple.
- Transient recovery is measured to within a 1% error band for a load step change of 75% to 50% to 25%.
- To meet the requirements of EN 61000-4-4 and EN 61000-4-5, an external filter capacitor is required. It is recommended that a 680 μ F/100V (or two 330 μ F/100V capacitors connected in parallel) be used.
- Operation at no-load will not damage these units. However, they may not meet all specifications.
- Dual output units may be connected to provide a 10 VDC, 24 VDC or 30 VDC output. To do this, connect the load across the positive (+Vout) and negative (-Vout) outputs and float the output common.
- It is recommended that a fuse be used on the input of a power supply for protection. See the table above for the correct rating.
